

# A Partnership of Integration

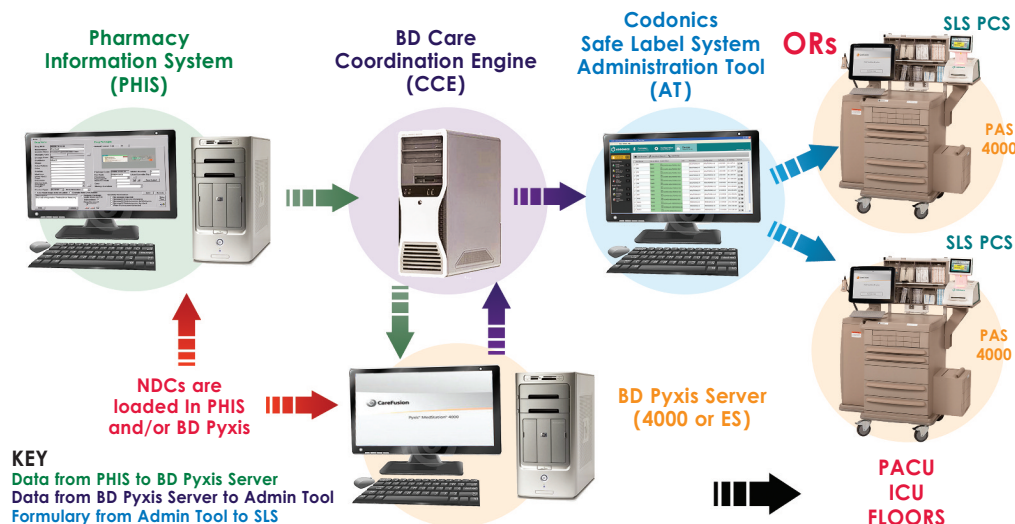

## Optimize patient care through enhanced system integration anywhere medications are prepared

In hectic environments like the OR and procedural areas, technologies need to be seamlessly connected to help improve efficiency, reduce errors and, ultimately, enhance patient care. Codonics and BD have partnered to provide improved healthcare through greater system integration. **Together, Codonics Safe Label System (SLS) and BD Pyxis™ Anesthesia Station deliver increased medication safety for anesthesia providers and introduce an unmatched simplicity to the pharmacy workflow.**

With the BD Care Coordination Engine (CCE) as the link that connects these devices to the Pharmacy Information System (PHIS), formulary optimization is taken to a new level. Through our centralized, integrated system, it has never been easier for pharmacy to manage, maintain and deploy customized formularies anywhere medications are prepared. This exclusive integration greatly reduces the administrative tasks required by pharmacy to manage and maintain a formulary. Formulary synchronization is automatic, fast and simple, designed to provide pharmacy with more time to focus on decision making rather than multiple, manual administrative tasks. Together, Codonics and BD are achieving improved patient outcomes with enhanced efficiency.

### BD Formulary Sync Workflow

With BD & Codonics, formulary synchronization is automatic, fast and simple.

#### Benefits of Integration:

- Introduces simplicity to formulary management and maintenance to improve efficiency
- Greatly enhances pharmacy workflow by eliminating multiple administrative tasks associated with formulary maintenance
- Increases medication safety
- Minimizes Drug Not Found (DNF) errors in the OR to simplify the anesthesia workflow

With the formulary synchronized and deployed, a heightened level of safety is achieved. The BD Pyxis system strengthens control over system access and keeps controlled access over high-risk medications, and SLS ensures safety and compliance every time a medication is prepared. SLS is conveniently situated on the BD Pyxis Anesthesia Station to significantly enhance the workflow. When a medication is removed from the BD Pyxis Anesthesia Station, the anesthetist scans it on SLS and it is immediately identified against the on-board formulary. An audible and visual confirmation of the drug in hand is presented and as the medication is prepared, an on-demand Joint Commission-compliant full color label is printed and ready to apply to the syringe. Removing the element of human error, SLS puts an end to the need for handwritten and pre-printed medication labels, eliminates incomplete labeling, ensures compliance and significantly improves patient safety.
